# GIS Abstracts Geography into a Modern Information Technology Framework

*...Abstracting Geographic Knowledge*

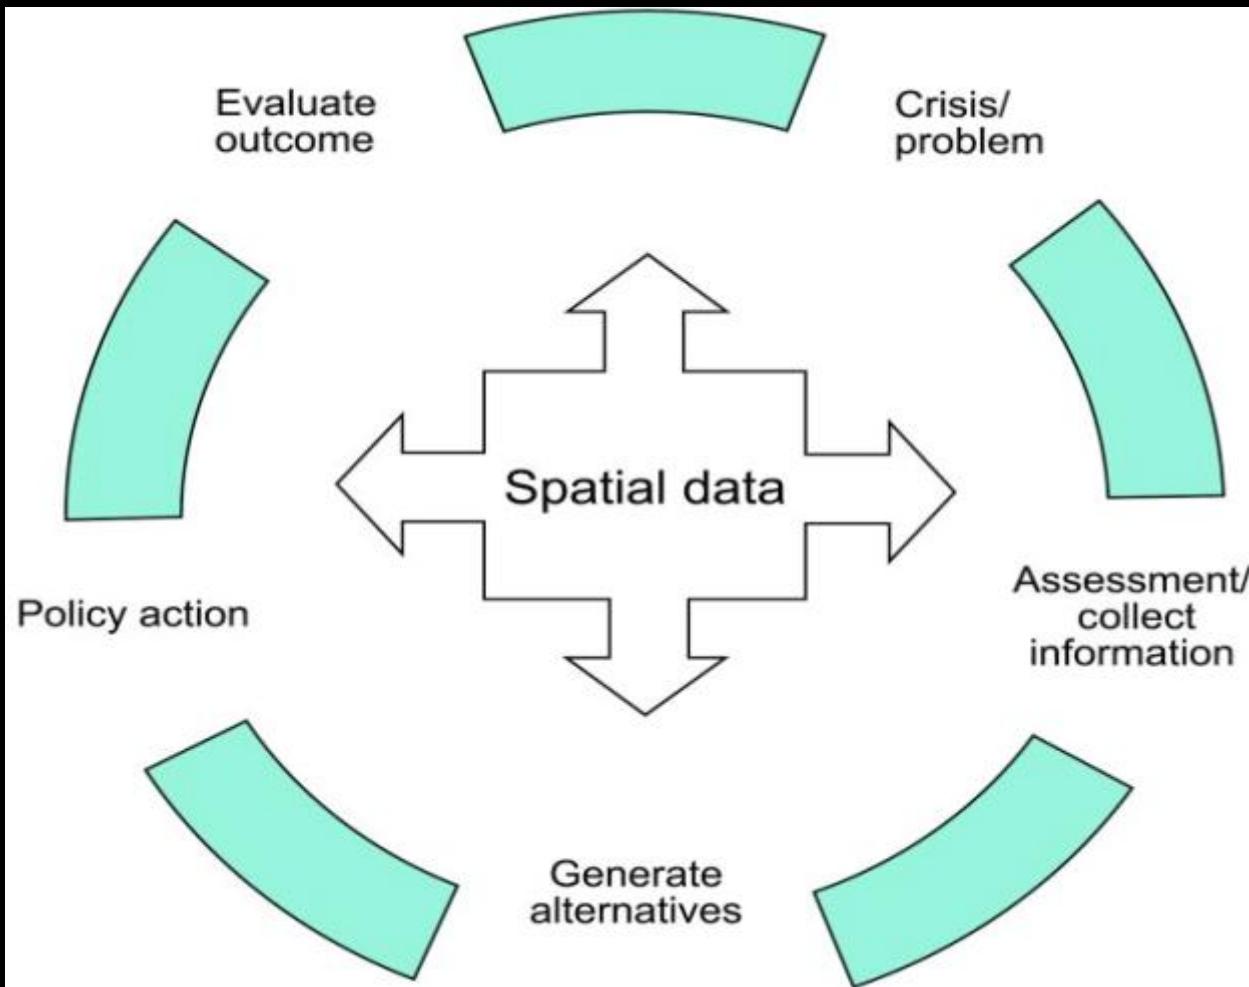

*... an Information System for Geography*

Data are the fuel for scientific analysis and decision-making

**Spatial information affects  
60 - 80% of all decisions**

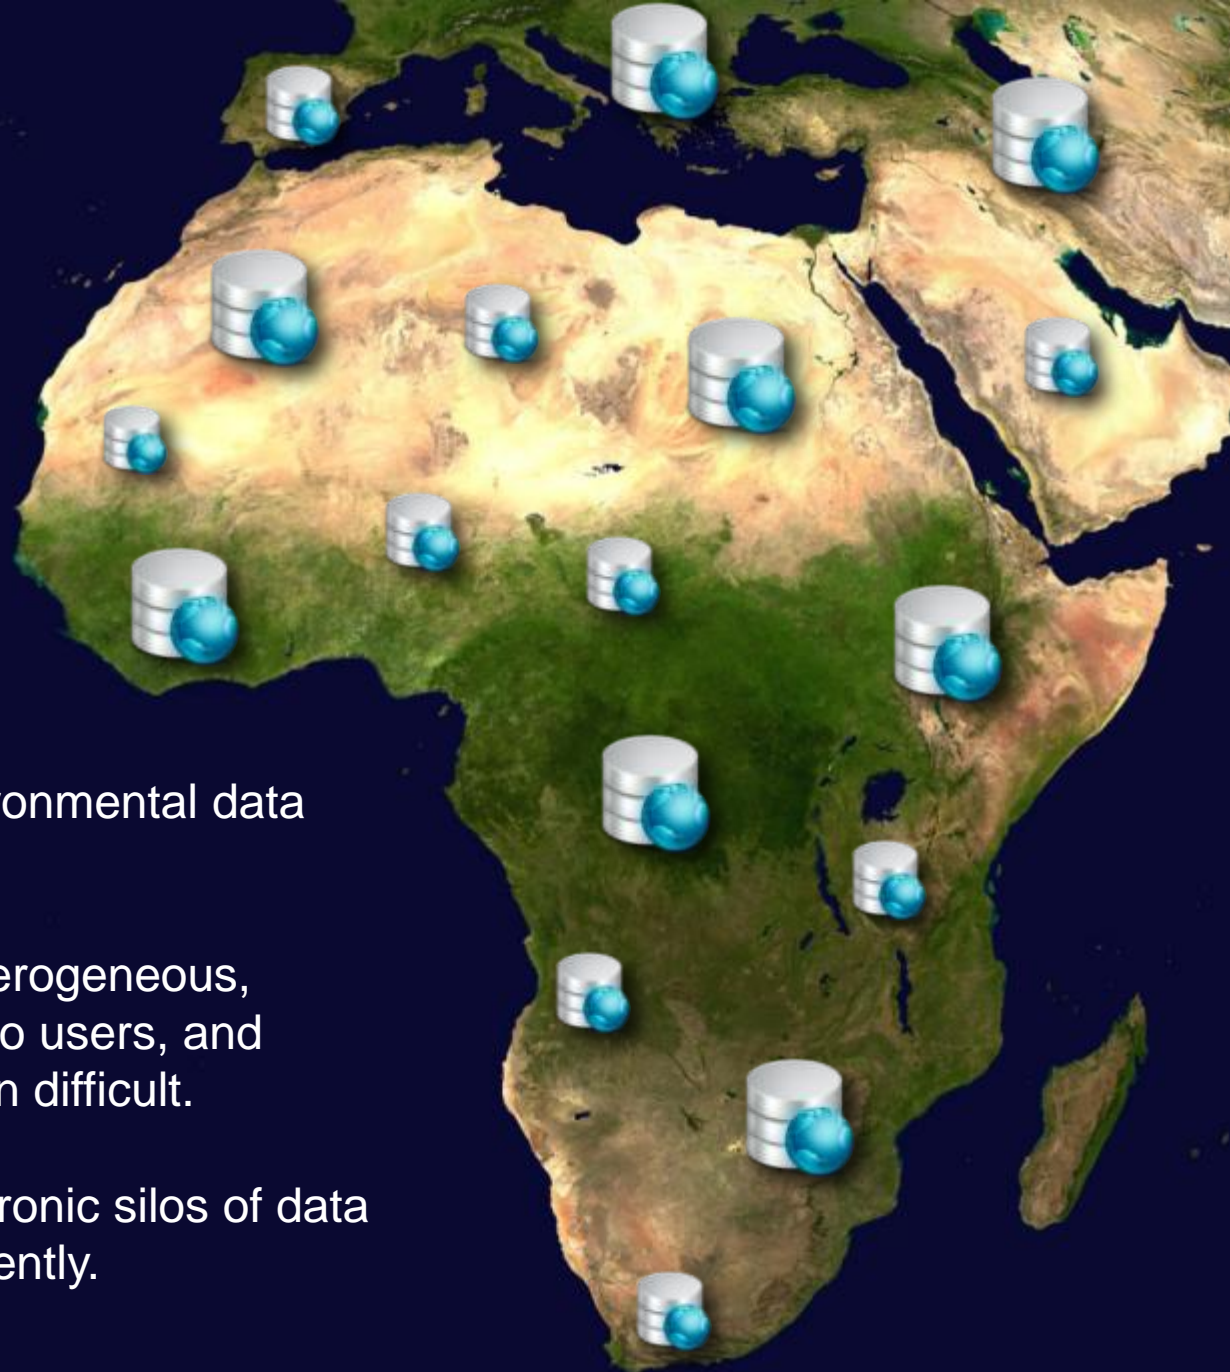

What is the real  
situation?

## DATA: BY THE NUMBERS

Finding environmental data is difficult.

There are a lot of environmental data repositories.

However, they are heterogeneous, disconnected, hidden to users, and accessing them is often difficult.

They are stored in electronic silos of data and are not used efficiently.

Operated in  
isolation...

Talking about Landsat...

*“In spite of the great need for that information, the vast majority of those images have never fired a single neuron in a single human brain. Instead, they are stored in electronic silos of data”*

*Al Gore (1998)*

Turning raw data into  
understandable information

*Al Gore (1998)*

## Data are expensive to produce

More than 50% of time lost in searching data and information while preparing environmental reports.

*Craglia et al. (2010)*

Many “islands” of data of different formats and quality.

data policies

# How to connect distributed & heterogenous data sources?

# Spatial Data Infrastructure

An SDI can be seen as enabling environment that supports an easy access to and utilization of geospatial data.

SDIs are more than just data repositories.

They allow to discover, visualize, evaluate, and access geospatial data and information.

This is an environment where users can interact continuously with data. The objective is to bring data as close as possible of the users and answer to their needs.

SDIs are aiming to maximize the reuse of data.

They can be compared as a road, allowing the movement of data.

It is important to keep in mind that SDIs are all about:

- reuse: data, capabilities, skills, investments, ...
- sharing: data, knowledge, ...
- learning from others: collaboration and co-operation

The objective is to facilitate the work of every user

**Working smarter  
and not harder**

Unlock the power of data,  
information, and services

## Data can be a shared resource

Through an SDI, data can be seen as a shared resource that can be exchanged with other domains and communities.

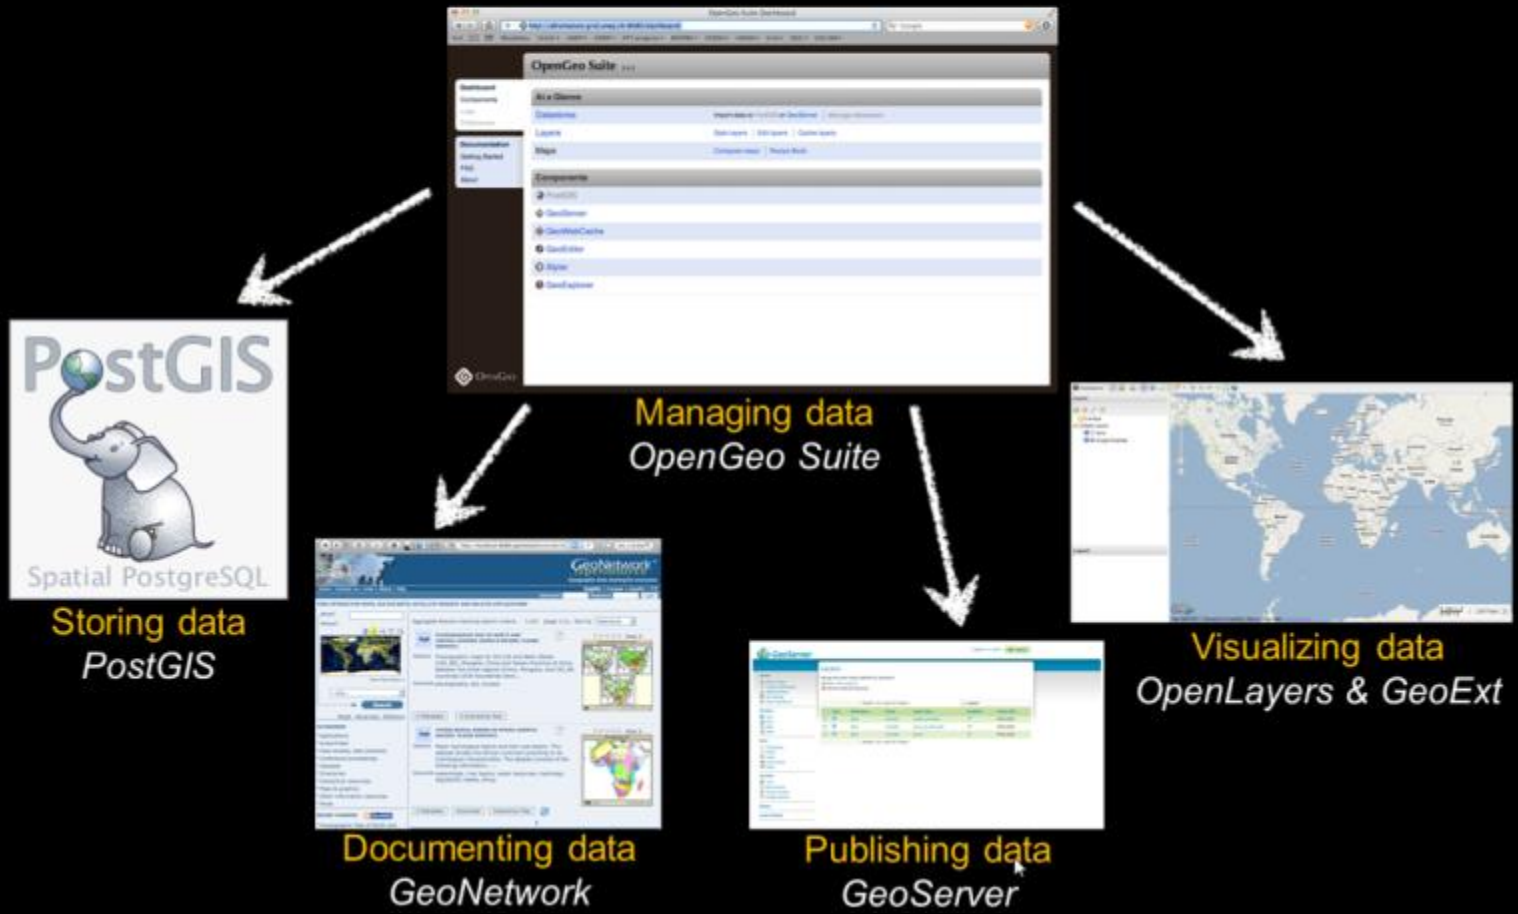

They are like pieces of a puzzle who will fit together and can be useful to different categories of users.

# Exemple of SDI composants

(built around Free and Open Source Software):

## Support end-users

Facilitate discovery and access of existing data

Create and make available new data sets

Contribute to data sharing initiatives like

## AFROMAISON GIS WORKSHOP

<b>Project/subject</b>	AFROMAISON : Africa at a meso-scale: adaptive and integrated strategies for natural resource management grant agreement n° 266379. Collaborative project
<b>Document</b>	Gis_workshop.docx
<b>Date</b>	20 February 2012
<b>Author</b>	Gregory Giuliani, Yaniss Guigoz, Bruno Chatenoux
<b>Update history</b>	15 December 2011: creation
<b>Material</b>	Bruno Chatenoux, Gregory Giuliani, Harvard University, SpatialThou

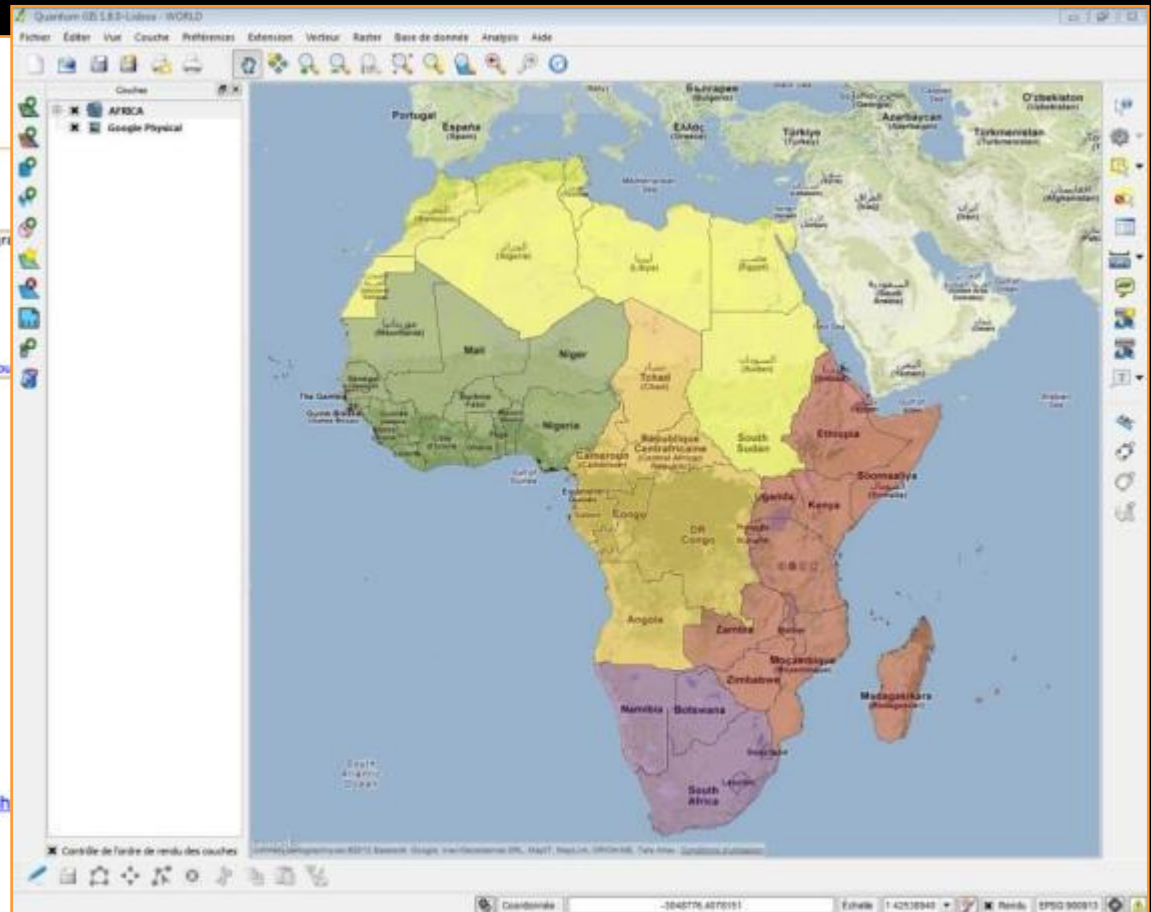

### AFROMAISON GIS WORKSHOP

- 1 QGIS and GRASS installation
- 2 Customizing QGIS
- 3 Adding data (vector and raster)
- 4 Projections
- 5 Finding and adding WMS & WFS data
- 6 Mapping
- 7 Data analysis & handling
- 8 Performing Spatial Queries

More tutorials are available at:

- Quantum GIS (QGIS) Tutorials: <http://qgis.spatialthought.com/>
- AWF-Wiki: [http://wiki.awf.forst.uni-goettingen.de/wiki/index.php/QGIS\\_tutorial](http://wiki.awf.forst.uni-goettingen.de/wiki/index.php/QGIS_tutorial)
- Harvard QGIS workshop: <http://maps.cga.harvard.edu/qgis/wkshop/>
- Baruch Geoportal: <http://www.baruch.cuny.edu/geoportal/practicum/>

The procedure described in the tutorial is for a windows platform but for each main step the procedure for Mac users is also indicated.

We have taught to more than three hundred participants (in different countries) how to share their data and metadata using SDI and OGC standards.

## Description of the workshop

The "Bringing GEOSS services into practice" workshop aims at teaching how to configure, use and deploy a set of open source software to set up a spatial data infrastructure (SDI). Trainees will learn how to publish and share data and metadata using OGC and ISO standards and how to register services into the Global Earth Observation System of Systems (GEOSS).

The material related to the workshop (a **tutorial in PDF**, a **virtual machine in OVA format** and some general documentation on SDIs) can be **downloaded here**. The tutorial is available in [iTunesStore](#) and [Google Play Books](#). More precise information on how to start with the workshop is available from [here](#).

The programme of the workshop is the following:

- **Concepts** on spatial data infrastructures
- How to **store** geospatial data? (PostGIS and flat rasters)
- How to **publish** geospatial data? (GeoServer, WMS, WFS, WCS, KML, SLD)
- How to **document and search** geospatial data? (GeoNetwork, CSW, ISO metadata)
- How to **process** geospatial data? (Python, WPS, PyWPS)
- How to **view** geospatial data? (WMS, OpenLayers, QGIS, KML)
- How to **download** geospatial data? (WFS, WCS, QGIS)
- How to **analyze** geospatial data? (WPS local/remote)

• How to share geospatial data? (GEOSS Discovery and Access Portal)

## Practical information

More than 400 people have been trained on this workshop in Bulgaria, Georgia, Morocco, Netherlands, Romania, Switzerland and Turkey.

The complete agenda of the workshop can be found [here](#).

## Bringing GEOSS services into practice

INFRASTRUCT.

VISION

SKILLS

FUNDS

# Interoperability

We need to make resources coming from different platforms interoperable like to pieces of puzzle who can fit together.

“Interoperability is the ability of two or more systems or components to exchange information and to use the information that has been exchanged. Interoperability facilitate the integration of data”.

# Interoperability

Standards, Standards, Standards, Standards, ...

To facilitate interoperability, several factors come into play.  
But the most important is the **STANDARD**.

Standards are reference documents defining specifications and providing technical features to ensure interoperability between different components.

**Geospatial and location standards for:**

- Aviation
- Built Environment & 3D
- Defense & Intelligence
- Emergency Response & Disaster Management
- Geosciences & Environment**
- Government & SDI
- Energy & Utilities
- Law Enforcement / Public Safety
- Mobile Internet & LBS
- Sensor Webs
- University & Research

The Open Geospatial Consortium (OGC) is the leading organization for geospatial standards. The provide more than thirty (30) standards for data discovery, visualization, access and processing.

WMS 1.3.0

**Web Mapping Service (WMS)**

HTTP protocol for publishing a collection of layers as a map (PNG, JPEG)

Data

WFS 1.1.0

**Web Feature Service (WFS)**

HTTP protocol for publishing feature collections that may be queried and updated by clients (features published as GML,...)

WCS 1.0

**Web Coverage Service (WCS)**

HTTP protocol for publishing “coverages” (multi-band raster data) that can be accessed by clients (GeoTiff, HDF)

Metadata

CSW 2.0.1

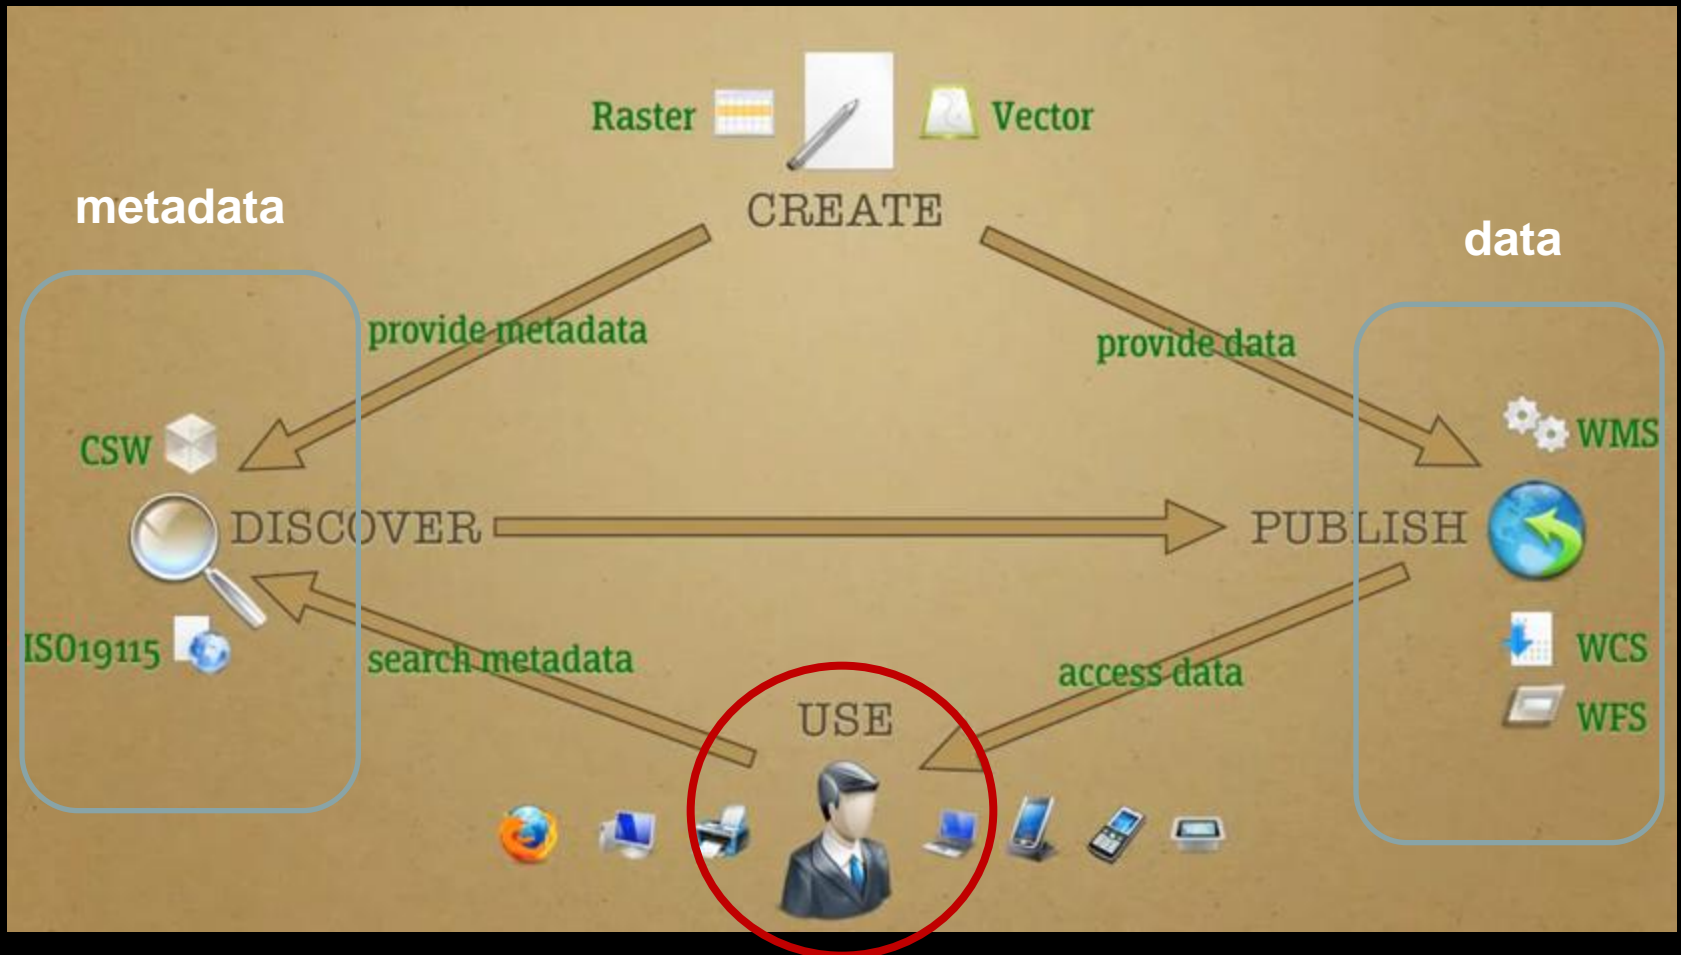

**Catalog Services for the Web (CS-W)**

Defines several web interfaces for data discovery

Processing

**Web Processing Service (WPS)**

Defines an interface to share geoprocessing algorithms

VISION

SKILLS

FUNDS

Data are essential for two things:

- Scientific analysis
- Decision making.

Without data and therefore no information, it is difficult to make good sound decisions.

“SDIs can be thought as social networks of people and organizations supported by data and technology”

“Technology is cheap, data is expensive, but social relations are invaluable”

*Craglia et al. (2009)*

collaboration, cooperation, social relations

# Capacity Building

# Africa Open Data

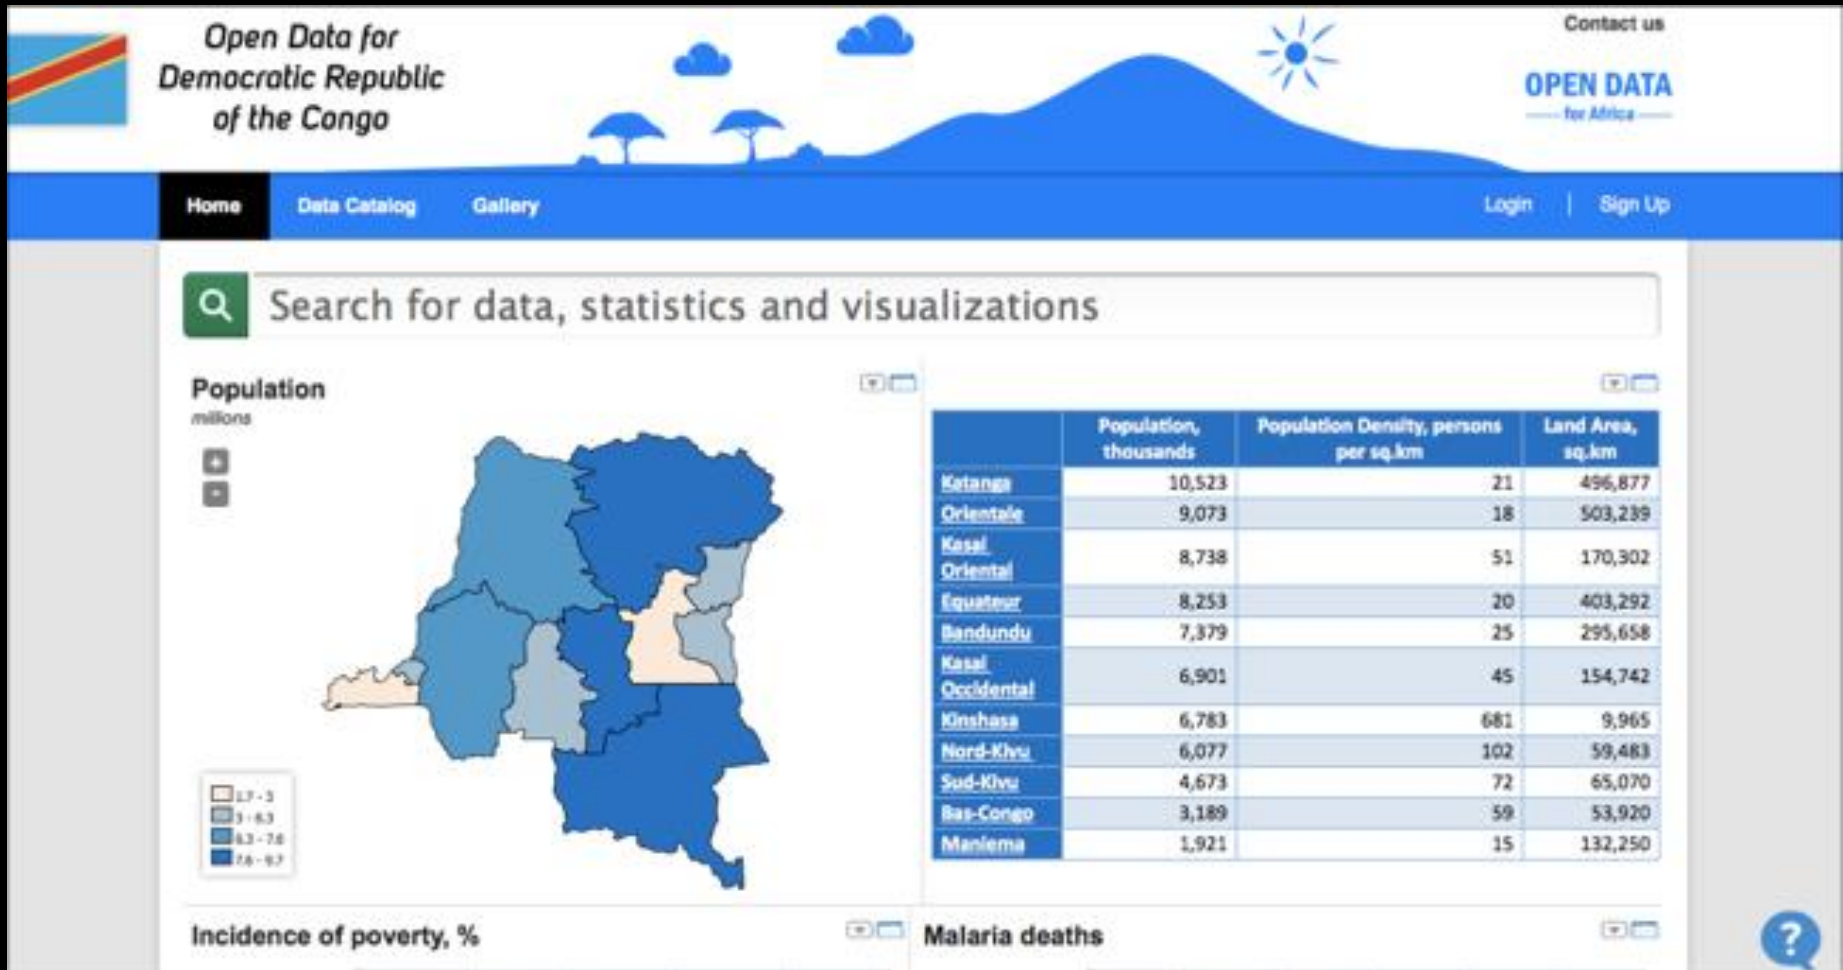

<http://africaopendata.org>

The screenshot shows the Africa Open Data website. At the top, there is a dark blue header with the text "Africa Open Data" on the left and navigation links "Datasets", "Groups", and "About" on the right. A search bar is located on the far right of the header. Below the header, the main content area features a map of Africa in the background. On the left side, there is a white box with the text: "Curating and opening up data all over Africa. This platform will be the largest central repository for Government, Civil Society, Corporate and Donor Agency Data. This is an Ujuzi Initiative." Below this text is a section for "d|bootcamp" in Lilongwe, Malawi, dated June 12 to 14, 2013. It includes a navigation menu with items like "Home", "About", "Sponsors", "Partners", "FAQ", "Resources", "Contact", and "Login/Logout". A "Resources" section is also visible. On the right side, there is a dark blue box titled "Search Africa Open Data" with a search input field containing "eg. Budget" and a search icon. Below the search box, there are "Popular Tags" for "kenya", "kodi", and "county".

La «donnée ouverte» s'inscrit dans une tendance qui considère l'information publique comme un **bien commun** dont la diffusion est d'intérêt public et général.

# DRC Open Data

<http://drcongo.opendataforafrica.org>

# Without sharing environmental data:

- ▶ doing science can be difficult,
- ▶ taking sound decisions can be problematic,
- ▶ and envisioning a sustainable development can be complicated.

Publicly funded data are a public good, produced in the public interest and thus should be freely available to the maximum extent possible.

Sharing and documenting data is  
part of the elementary scientific  
approach.

Enhance scientific accountability  
and credibility.

Make your data discoverable

Promote GEOSS & OGC

Spending more time in doing science  
... and less in searching data!

UNIVERSITÉ  
DE GENÈVE
